EXAMINER'S STATEMENTS OF REASONS FOR ALLOWANCE

1. Claims 1-13 are allowable over prior art references because related references do not disclose modifying digital coefficients of a filter at a relay station by receiving a master signal, modifying the master signal to produce a second signal, and transmitting the second signal, wherein the transmission of the second signals is interrupted to estimate an interference of the signal and store the estimate; after resuming transmission of the second signal, modifying the digital coefficients of the filter. Claims 14, 19, and 22 are allowable over prior art references because related references do not disclose modifying digital coefficients of a filter at a relay station by receiving a master signal, modifying the master signal to produce a second signal, and transmitting the second signal, wherein the coefficients are modified by deriving a Fourier transform of the second signal; deriving correction values based on the Fourier transform; transforming the correction values using an IFFT; and modifying the filter coefficients based on the transformed correction values. Claims 15, 20, and 23, allowable over prior art references because related references do not disclose modifying digital coefficients of a filter at a relay station by receiving a master signal, modifying the master signal to produce a second signal, and transmitting the second signal, wherein the coefficients are modified by deriving an estimate of differences between consecutive segments of the master signal; estimating an error in the estimation of the differences; and modifying the filter coefficients to reduce the estimated error. Claims 16-18, and 21 are allowable over prior art references because related references do not disclose modifying digital coefficients of a filter at a relay station by receiving a master signal, modifying the master signal to produce a second signal, and transmitting the second signal,

wherein a switch selectively transmits the second signal and can be controlled not to transmit the second signal when it is desired to estimate multipath interference in the master signal.

Conclusion

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Namiki (U. S. Patent No. 4, 701, 935) and Lovinggood et al. (U. S. Patent No. 6, 697, 603) discloses repeater (relay) stations which include filtering a received signal.
